

PREPARING YOUR EQUIPMENT FOR WINTER

Winter operations have unique demands on your equipment. They need special attention to key items before committing them to a tough production season.

Six critical items lead our winter checklist:

The Right fluids

Ensure the engine oil, coolant and diesel fuel in the machine are suited for cold weather operation.

Avoid Freezing Lines

Drain the water out of the fuel/water separator daily to prevent damage to the high-pressure fuel system and engine.

Startup

Let the engine idle for five minutes or so, then gradually increase RPM. Also ease in working the hydraulics.

Undercarriage

Clean the undercarriage out after each use.

Parking

Park the machine on a dry area and clean any exposed portion of the cylinder rods.

Hydraulic System

Regularly inspect the hydraulic oil.

Call your Product Support Sales Representative for further details and more cold-weather tips. Your PSSR will schedule your servicing and work with you to stock your shelves with the solutions you need for winter.
